HW 13 2.10.2,4,6,10

2.10.2. Let f and g be bounded linear functionals with domains in a normed space X. Let α, β be nonzero scalars. We define a function $h = \alpha f + \beta g$. Since h is defined in terms of f, $\mathcal{D}(h) \subset \mathcal{D}(f)$. Similarly, $\mathcal{D}(h) \subset \mathcal{D}(g)$. Thus, $\mathcal{D}(h) \subset \mathcal{D}(f) \cap \mathcal{D}(g)$. Further, let $x \in \mathcal{D}(h)$. So $h(x) = \alpha f(x) + \beta g(x)$ is defined. So $x \in \mathcal{D}(f) \cap \mathcal{D}(g)$. Thus, $\mathcal{D}(h) = \mathcal{D}(f) \cap \mathcal{D}(g)$.

Since h takes on values of X and maps them to real-valued numbers (since it is a linear combination of real-valued numbers), h is indeed a functional. It suffices to show it is bounded. Note that for all $x \in \mathcal{D}(h)$,

$$|h(x)| = |\alpha f(x) + \beta g(x)| \tag{1}$$

$$\leq |\alpha f(x)| + |\beta g(x)| \tag{2}$$

$$\leq |\alpha||f(x)| + |\beta||g(x)| \tag{3}$$

$$\leq |\alpha|c||x|| + |\beta|d||x|| \tag{4}$$

$$= (|\alpha|c + |\beta|d)||x||, \tag{5}$$

where $c, d \in \mathbb{R}$ since f and g are bounded linear functionals. Thus, h is a bounded linear functional.

2.10.4. Let X and Y be normed spaces and $T_n: X \to Y$ $(n = 1, 2, \cdots)$ bounded linear operators. Assume that $T_n \to R$. Let $\epsilon > 0$ and choose N. Then when n > N, we see that $||T_n - T|| \le \epsilon$. Let $x \in \overline{B(x_0; \epsilon^*)}$. So $||x - x_0|| \le \epsilon^*$. Then we see that

$$||T_n x - Tx|| = ||T_n x - Tx + Tnx_0 - Tnx_0 + Tx_0 - Tx_0||$$
(6)

$$\leq ||T_n x - Tx - T_n x_0 + Tx|| + ||T_n x_0 - Tx_0|| \tag{7}$$

$$= \|(T_n - T)(x - x_0)\| + \|(T_n - T)x_0\|$$
(8)

$$\leq ||T_n - T|| ||x - x_0|| + ||T_n - T|| ||x_0|| \tag{9}$$

$$<\epsilon(\epsilon^* + ||x_0||). \tag{10}$$

We choose $\epsilon_{x_0} = \frac{\epsilon}{\epsilon^* + \|x_0\|}$ such that $\epsilon_{x_0} < \epsilon'$. Since ϵ is arbitrary, then $\|T_n x - Tx\| < \epsilon'$.

2.10.6. Let X be the space of ordered n-tuples of real numbers and $||x|| = \max_i |x_i|$ where $x = (x_1, ..., x_n)$. Thus the norm on the dual space is $||f|| = \sup_{x \in X, x \neq 0} \frac{|f(x)|}{\max_i |x_i|}$.

2.10.10. Let X and $Y \neq \{0\}$ be normed vector spaces, with dim $X = \infty$. Let $B = (x_1, x_2, ...)$ be a Hamel basis for X. Define a linear operator $T: X \to Y$. Let $y \in Y$ such that $y \neq 0$. Then we define T as

$$T(x_1) = y \tag{11}$$

$$T(x_2) = 2y \tag{12}$$

$$\vdots (13)$$

$$T(x_i) = iy (14)$$

$$\vdots (15)$$

and $T(\alpha x_i) = \alpha i y$ for some scalar α . Further, we define it such that $T(x) = T(\sum_{i=1}^{\infty} \alpha_i x_i) = \sum_{i=1}^{\infty} \alpha_i T(x_i)$. This function is clearly well-defined and linear.

Now we show that T is not bounded. We know that $||Tx|| = ||\sum_{i=1}^{\infty} \alpha_i(i)y|| \leq \sum_{i=1}^{\infty} \alpha_i i||y|| = \infty$. So T is not bounded.
